

BioHandler

Feature – **wvl**, **bev** (not implemented)

When PandaListener receives a wvl from panda it passes the message to BioHandler. BioHandler writes the biometric info to the measurements Table and sends and ack to PandaListstner.

Once **bev** feature is enabled, BioHandler will send critical bio info to AlertHandler. At that point alert handler writes the event to the events table, reads emails, locations, residents, people, eventseverities, eventsource and eventtypes tables, generates an alert and writes to the sentalerts table.
